

Block Percentage Formula

By: Joshua Constante Quinto

INTRODUCTION

The Block Percentage System (BPS) tracks price movements by identifying points where price stops and accelerates. It follows a structured Block Framework, which can be divided into specific numerical values such as 1.16, 1.55, 1.75, 2.5, 2.8, 4, and 15.

This system provides insights into hidden market structures, allowing deeper control over price movements. Additionally, BPS incorporates a sigil that serves as a visual representation of my identity and the formula's influence on financial systems.

$B[\%] = \text{Block percentage}$

$T_b[\%] = \text{Total Block percentage}$

$H_b[\%] = \text{Half Block percentage}$

Given:

No. of Blocks: 5

Two blocks total: 0.41%

Formula:

$\text{Blocks \%} = (2 \text{ blocks}) / 5$

$\text{Total Blocks \%} = \text{Blocks \%} + \text{Two blocks}$

$H_b[\%] = T_b[\%] / 2$ or 1.16, 1.55, 1.75, 2.5,

2.8, 4, and 15

Answer:

$B[\%] = 0.41 / 5 = 0.082$

$T_b[\%] = 0.082 + 0.41 = 0.492$

$H_b[\%] = 0.492 / 2 = 0.246$
